

The Intelligent Era Manifesto v1.0 (智能时代宣言 v1.0)

Core Idea:

From “Laws” to “Emergence” — A Leap in Cognitive Paradigm.

The evolution of human civilization is, in essence, a continuous redefinition of core rules. We are standing at the threshold of a leap from “human-designed logic” to “data-driven emergence.”

Introduction: Starting from “Redefining Rules” — What happens when rules are no longer explicitly defined by humans or nature?

- The Industrial Age: Its core was harnessing energy, following deterministic and predictable physical laws.
- The Information Age: Its core was processing information, following precise, controllable, human-defined binary rules (such as binary code and programming languages).
- The Intelligent Age: Its core is creating knowledge, following statistical laws and optimization strategies that algorithms automatically learn and dynamically emerge from vast amounts of data.

Part 1: A Three-Tier Progression — Bits, Models, and Agents

- Bits: The “atoms” of the intelligent era, the physical foundation of all digitization.
- Large Language Models (LLMs): From the “meaning processors” of bits to the “super-brains” of agents. They overturn the old paradigm of “humans find the rules, machines execute,” and usher in a new model where “machines find the rules from data, and humans set the goals.”

- Agents: A “complete living entity” that autonomously acts to achieve goals. They are the combination of brain, limbs, and purpose, grounding intelligence through the “perception-planning-action” loop to create real-world value.

Part 2: Core Tensions — The Gap Between Ideal and Reality

- The Contradiction Between Reliability and Autonomy: The “brain’s” hallucinations and unreliable reasoning may be infinitely magnified during autonomous action, leading to catastrophic consequences.
- The Contradiction Between Flexibility and Fragility: The “limbs” are powerful when executing predefined tasks, but become exceptionally fragile when confronting the surprises and complexities of the real world.

The Dawn of a New Paradigm. The rules of the intelligent era have been internalized as high-dimensional weights and probabilities within neural networks, beyond human intuitive comprehension. We are creating a brand-new capacity to handle complexity and uncertainty, whose core shifts from “precise commands” to “optimized objectives.” This is not merely a technological evolution, but a fundamental paradigm leap in the way humans perceive and reshape the world.
